

MacBook Pro 2012 — Sonoma/Ventura Install Guide (OCLP)

2026-09-18 · @Someone

Shuruaat mein

Machine: **MacBook Pro Mid 2012**. Official tor par ye sirf **macOS Catalina (10.15)** tak support karta hai. Ventura ya Sonoma chalane ke liye **OpenCore Legacy Patcher (OCLP)** zaroori hai — iske bina kisi bhi tareeke se install nahi hoga. Windows PC se USB banane ka koi faida nahi, kyunki OpenCore sirf macOS par hi build ho sakta hai.

Abhi tak kya ho chuka hai:

- Sonoma installer download ho chuka hai — `/Applications/Install macOS Sonoma.app`, size **13 GB** (sahi size hai)
- Date aur time sahi hain
- USB drive **32 GB** ki hai
- Pichle attempts mein do error aaye the: *"Sonoma is not applicable for this machine"* aur USB banate waqt **99% par installer corrupted**

Is note ko kaise use karna hai:

Seedha **Step 0** se shuru karein. Wahan ek command hai jo batayega ki aapko **Case A** follow karna hai ya **Case B**. Us result ke bina aage mat jayein — warna wahi purani galti dohrayi jayegi.

Sabse pehle backup. Time Machine se ya external drive par zaroori data copy kar lein. Is process mein drive erase ho sakti hai.

Step 0 — Pehle ye check karein (5 minute)

Terminal kholein (Applications → Utilities → Terminal) aur teen cheezein check karein.

1. Date sahi hai?

```
date
```

Agar galat date aaye to set karein (format `MMDDhhmmCCYY`):

```
sudo date 091814002026
```

2. Installer ka size:

```
du -sh /Applications/Install\ macOS\ Sonoma.app
```

13 GB ke aas-paas hona chahiye. Agar 8–10 GB ya kam hai → **Case B**.

3. Signature check — ye sabse important hai:

```
spctl -a -vvv -t install /Applications/Install\ macOS\ Sonoma.app
```

Ab result ke hisaab se raasta chunein:

Output mein ye dikhe	Matlab	Kahan jayein
accepted + source=Notarized Developer ID	Installer bilkul theek hai	Case A
rejected	File corrupt hai	Case B
a sealed resource is missing or invalid	File corrupt hai	Case B
CSSMERR_TP_CERT_EXPIRED	Certificate expire ho gaya	Case B (nayi 14.7.x download)

Ye teeno command ka result kahin likh lein ya photo le lein — agar phir bhi problem aaye to isse pata chal jayega ki asli wajah kya hai.

Case A — "accepted" aaya to

Installer theek hai. Ab USB banani hai. Poora process 2–3 ghante ka hai.

A1. Sleep band karein (ye skip mat karein)

System Preferences → **Energy Saver** → "Prevent computer from sleeping automatically when display is off" **on** karein. Aur laptop ko charger par lagayein.

Sleep mein jana hi 99% par fail hone ki sabse badi wajah hai.

A2. USB drive erase karein

1. USB ko **USB 3.0 port mein direct** lagayein — koi hub, extension ya adapter nahi
2. **Disk Utility** kholein
3. Menu bar → **View → Show All Devices** (ye zaroori hai, warna galat cheez erase hogi)
4. Left side mein sabse **upar wali USB entry** select karein — andar wali indented partition nahi, uske upar wali physical drive
5. **Erase** par click karein:
 - Name: `MyVolume`
 - Format: **Mac OS Extended (Journaled)**
 - Scheme: **GUID Partition Map**
6. Erase

A3. OCLP se installer banayein

1. OCLP app kholein
2. **Create macOS Installer**
3. **Use existing macOS Installer** — dobara download mat karein, jo 13 GB waala already hai wahi use karein
4. List mein se **Sonoma** select karein
5. USB drive (`MyVolume`) chunein
6. Password maangega, daal dein

Ab 30–60 minute lagenge. **Laptop ko haath mat lagayein, lid band mat karein.** Beech-beech mein mouse hila dein.

A4. OpenCore build karein aur USB par install karein

Ye alag step hai — A3 ke baad zaroori hai. Isko skip karne se hi "not applicable for this machine" error aata hai.

1. OCLP ke **main menu** mein wapas jayein
2. **Build and Install OpenCore** par click karein
3. Build complete hone ka wait karein
4. **Install to disk** par click karein
5. Disk list mein **wahi USB drive** select karein
6. Uski **EFI partition** select karein (usually `EFI` ya `disk2s1` jaisa kuch)

7. Install

A5. USB se boot karein

1. **Shut down** karein (restart nahi, poora shut down)
2. Power button dabayein aur foran **Option (⌥) key** dabaye rakhein
3. Boot picker aayega. Ab dhyan se:
 - **"EFI Boot"** select karein — ye orange/grey icon hoga
 - **"Install macOS Sonoma"** seedha select **NAHI** karna, chahe wo dikhe
4. Ab OpenCore ka apna picker aayega (alag, simple look ka screen)
5. **Usme se** "Install macOS Sonoma" select karein

A6. macOS install karein

1. Installer load hone dein (5-10 minute lag sakte hain, patience rakhein)
2. Agar naya install chahiye: **Disk Utility** se internal drive erase karein (APFS, GUID)
3. Agar upgrade chahiye: seedha **Install macOS** par jayein aur apna existing drive chunein
4. Installation shuru karein

Machine **kai baar restart hogi** — 3 se 4 baar. Har restart par OpenCore picker aayega aur wo khud aage badh jayega. Ye normal hai. Total 40-90 minute.

A7. Internal drive par OpenCore install karein

Ab Sonoma chal raha hoga, lekin USB ke bina boot nahi hoga. Isko fix karein:

1. Naye Sonoma mein OCLP dobara kholein (USB se copy kar lein ya dobara download kar lein)
2. **Build and Install OpenCore**
3. **Install to disk**
4. Is baar **internal drive** select karein (USB nahi)
5. Uski EFI partition
6. Restart

Ab USB nikal sakte hain.

A8. Root patches apply karein — sabse zaroori step

Restart ke baad OCLP khud detect karega ki graphics acceleration missing hai.

1. OCLP ek **"Post-Install Root Patch"** ka prompt dega — agar na de to OCLP kholkar khud **Post-Install Root Patch → Start Root Patching** par jayein
2. Patches apply hone dein (10–15 minute)
3. **Restart**

Ab graphics smooth challenge, WiFi kaam karega, aur system normal lagega. **Iske bina Sonoma bahut slow aur laggy rahega.**

Case B — "rejected" ya galat size aaya to

Installer file kharab hai — 13 GB hone ke bawajood. Isko fresh download karna padega. **USB dobara banane ki koshish mat karein, wahi error aayega.**

B1. Purana installer delete karein

```
sudo rm -rf /Applications/Install\ macOS\ Sonoma.app
```

Ya Finder se `Install macOS Sonoma.app` ko Trash mein daalein, phir **Trash empty** karein. Adha-adhoora file rehne se OCLP confuse hota hai.

B2. Download ke liye machine tayyar karein

Ye teeno karein, warna phir se adhoora download hoga:

- **Ethernet cable lagayein.** 2012 MacBook Pro mein Ethernet port hai. WiFi se kaafi tez aur reliable hai. Ye sabse bada farak dalega.
- **Sleep off karein:** System Preferences → Energy Saver → sleep prevent on
- **Charger lagayein** aur baaki saare apps band kar dein

B3. Dobara download karein

1. OCLP kholein
2. **Create macOS Installer → Download macOS Installer**
3. List mein se **sabse latest Sonoma** chunein — `14.7.x` (koi bhi purana `14.0` – `14.4` mat lein, unke certificates expire ho chuke hain)
4. Download hone dein — **2 se 4 ghante** lag sakte hain, ise poora hone dein

Download ke doran laptop ko chhedein nahi. Agar beech mein ruk jaye to B1 se dobara shuru karein.

B4. Verify karein

Download ke baad **Step 0 ke teeno command دوبارا chalayein**. Ab ye aana chahiye:

- Size: **13 GB** ke aas-paas
- `spctl : accepted + source=Notarized Developer ID`

B5. Case A par jayein

Agar dono theek hain to upar **Case A** par jayein aur A1 se shuru karein.

Agar `spctl` **phir bhi rejected** de raha hai, to Sonoma chhod dein aur **Ventura** try karein (agla section). Do baar fresh download ke baad bhi fail hona batata hai ki Sonoma ke installer ke saath hi koi issue hai.

Ventura ka option — seriously consider karein

Agar Sonoma phir atak jaye, ya aap bas kaam khatam karna chahte hain, to **macOS Ventura 13.7.x** behtar choice hai.

Kyun:

	Sonoma 14	Ventura 13
Installer size	~13 GB	~12 GB
Ivy Bridge (2012) par speed	Slow, laggy	Kaafi behtar
HD 4000 graphics bugs	Zyada	Kam
RAM ki demand	Zyada	Kam
Security updates	2027 tak	2026 tak

Dono ko hi root patches chahiye, dono hi unsupported hain. Farak sirf rozana ke experience ka hai — **aur wahan Ventura clearly jeetta hai** is hardware par.

Kya badalna hai:

Kuch nahi, bas naam. Upar ke **saare steps bilkul same hain**, sirf do jagah `Sonoma` ki jagah `Ventura` likhein:

- Step 0 ke command mein: `/Applications/Install\ macOS\ Ventura.app`
- A3 aur A5 mein: list se Sonoma ki jagah **Ventura** select karein

Download karte waqt **13.7.x** chunein (sabse latest Ventura), purana **13.0** – **13.5** nahi.

Common errors aur unke fix

"Sonoma is not applicable for this machine"

Aap OpenCore ke through boot nahi kar rahe. Teen possible wajahein:

- Catalina ke andar se **Install macOS Sonoma.app** par double-click kiya — ye kabhi kaam nahi karega
- Option key waale boot picker se seedha "Install macOS Sonoma" select kiya — **"EFI Boot"** select karna hai
- Step **A4** skip ho gaya (OpenCore USB par install nahi hua)

"This copy of the Install macOS application is damaged"

- Date galat hai → **date** command se set karein
- Installer purana point release hai → latest **14.7.x** ya **13.7.x** download karein
- File corrupt hai → **Case B**

USB banate waqt 99% par fail

- Laptop sleep mein chala gaya → A1 karein
- USB hub ya adapter use ho raha hai → direct port mein lagayein
- Drive ka format galat hai → Mac OS Extended (Journaled) + GUID
- Drive khud kharab hai → dusri drive try karein (ye aakhri option hai, aapke case mein ye wajah nahi lagti kyunki alag volume par bhi same error aaya tha)

Boot picker mein "EFI Boot" dikh hi nahi raha

Step **A4** nahi hua ya galat disk par hua. OCLP → Build and Install OpenCore → Install to disk → **USB drive ki EFI partition**.

Install ke baad black screen ya bahut slow

Root patches nahi lage. Step **A8** karein.

Install ke baad USB nikalne par boot nahi ho raha

Step **A7** nahi hua — OpenCore internal drive par install karna zaroori hai.

Prohibited sign (circle with line) aa raha hai

NVRAM reset karein: shut down → power on karte hi **Option + Command + P + R** 20 second dabaye rakhein. Phir dobara boot karein.

Install ke baad — yaad rakhne wali baatein

Har macOS update ke baad root patches dobara lagane padenge. Update ke baad system slow lage to OCLP kholein → Post-Install Root Patch → Start Root Patching → restart. Ye permanent routine hai.

Jo cheezein kaam nahi karenge ya issue de sakti hain:

- **SIP disabled** rahega — security thodi kam ho jati hai, isliye unknown sources se apps install karne mein dhyan rakhein
- **FileVault** properly kaam nahi karega — encryption ki zarurat ho to alag solution dekhein
- **DRM content:** Safari mein Netflix, Apple TV app — in par issues aa sakte hain (Chrome mein Netflix chal jata hai)
- **Sleep/wake** kabhi-kabhi glitch karega
- **External display** par occasional problem
- **AirDrop, Sidecar, Handoff** — inme se kuch kaam nahi karenge

Performance ke liye:

- Agar abhi bhi HDD laga hai to **SSD zaroor lagayein** — iske bina Sonoma practically unusable hai
- **8 GB minimum, 16 GB behtar.** Non-Retina 2012 mein RAM khud upgrade kar sakte hain; Retina 2012 mein RAM soldered hai
- Login items kam rakhein, aur bhaari apps (Photoshop, Final Cut) se expectations kam rakhein
